Process-Fusion.net and Hexawise today announced a strategic collaboration to market and support science-based software test design methods supported by the Hexawise test design tool.

About Hexawise

The Hexawise test design tool provides a scientific approach to software test design based on a widely proven statistical method known as Design of Experiments. The web-based software as a service delivery model does not require knowledge of statistical methods. This tool is being applied with great success worldwide. Results to date demonstrate a 30% reduction in test design and execution effort compared to normal practices. Further, testers using this method discover 2.4 more defects per tester hour compared to business as usual practices. Groups of 15 or more testers are realizing at least 5x ROI with larger groups achieving 15x or higher. Please see www.Hexawise.com for additional information.

About Process-Fusion

Process-Fusion provides training, coaching, and consulting services related to software and IT best practices with a particular focus on software quality, software project management, software metrics, and process improvement. Please see www.Process-Fusion.net for additional information.
